- Recursion
- How to write a recursive code / tracing
- T.C & S.C of recursive codes → [next session]

Why recursion?

- Merge Sort / Quick Sort / Many other algorithms.
- Binary Tree / BST / BBST / Tries
- Dynamic Programming
- Backtracking
- Graph.

Recursion → function calling itself.

↓
solving a problem, using smaller instance of the same problem.
↓
sub-problem

$$\text{Sum}(N) = \underbrace{1 + 2 + 3 + 4 + \dots}_{(N-1)} + N$$

$$\text{Sum}(N) = \text{Sum}(N-1) + N$$

$$\text{sum}(4) = \text{sum}(3) + 4 \quad // \text{sum}(3) \text{ is a subproblem}$$

How to write Recursive codes?

Assumption : fix what should your function do.

Main logic : solving assumption using sub-problems

Base condition : Input values, for which we want to stop the recursion.

$N > 0$

int sum (N) { \rightarrow Given N , calculate & return sum of 1^{st} N natural no's.

```

    if ( N == 1 ) { return 1 }

    return ( sum( N-1 ) + N )
  
```

$1+2+3+\dots+(N-1)+N$: Sum of first N natural no's.

$$\text{sum}(3) = 6.$$

$$\text{sum}(4) = 10$$

$$\text{fact}(3) = 3 \times 2 \times 1 = 6, \quad \text{fact}(4) = 4 \times 3 \times 2 \times 1 = 24 \quad \text{fact}(5) = 120$$

$N \geq 1$

int fact (N) { \rightarrow Given N , calculate & return $N!$

```

    if ( N == 1 ) return 1
    return ( fact( N-1 ) * N )
  
```

$\text{fact}(N) = 1 \times 2 \times 3 \times \dots \times (N-1) \times N$

$\text{fact}(N) = \text{fact}(N-1) \times N$

function call Tracing.

```

int add ( N, m ) {
    return N+m
}
  
```

```

int mul ( x, y ) {
    return x*y
}
  
```

```

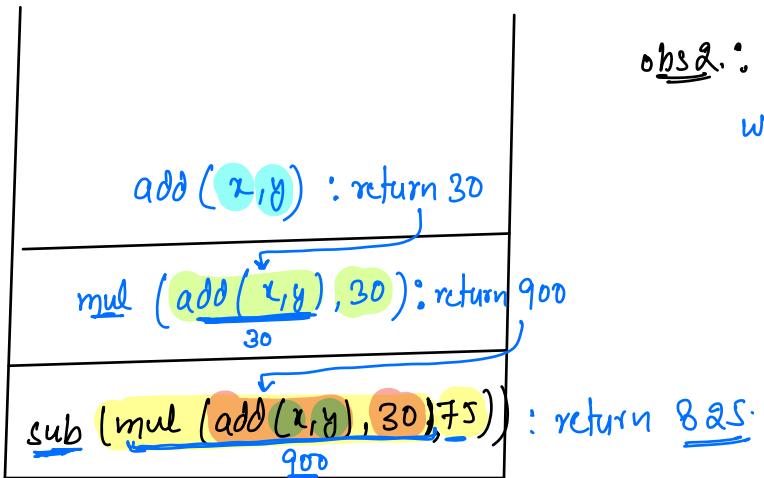

int sub ( x, y ) {
    return x-y
}
  
```

main () {
 $x=10, y=20$
 print (sub (mul (add (x, y), 30), 75))
 }

sub (mul (add (x, y), 30), 75) : return 825
 ↗
 mul (add (x, y), 30) : return 900
 ↗
 add (x, y) : return 30

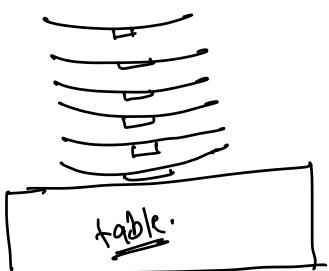

// Data Structure:

obs1: Whenever a function call is made, we need to add that function on the top.

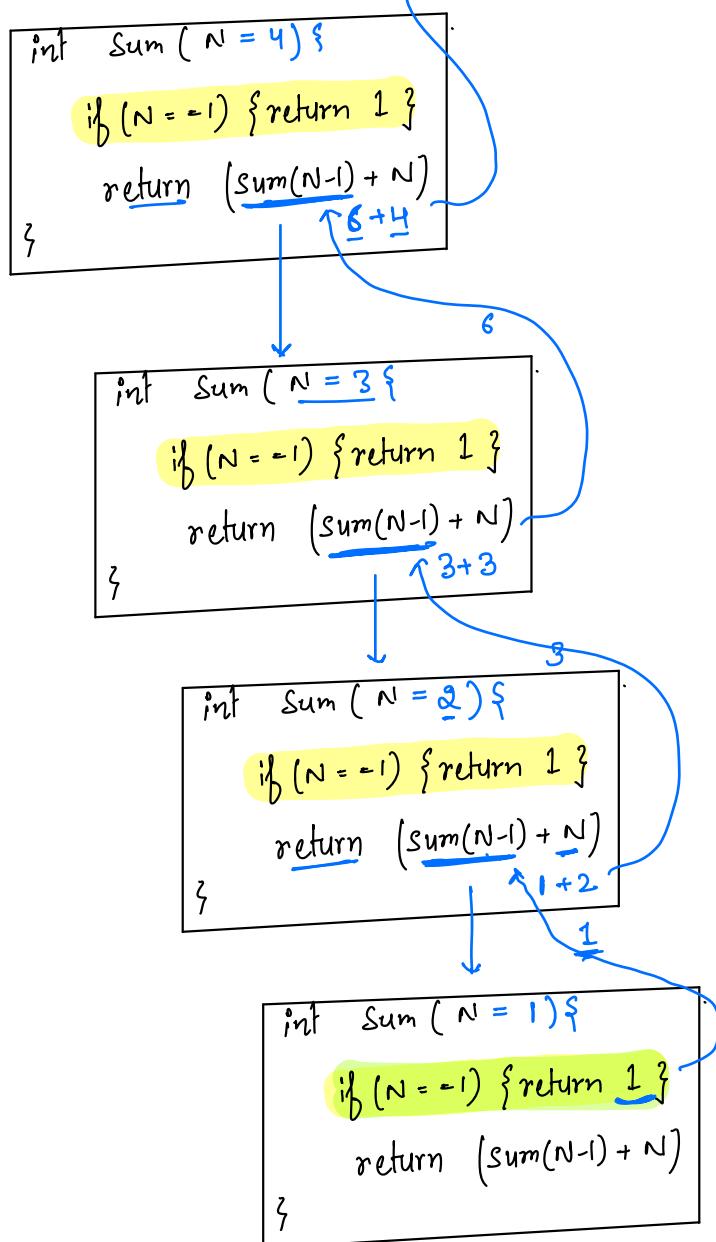

obs2: When function return, we remove it from the top.

[Note: All function calls are stored in stack]

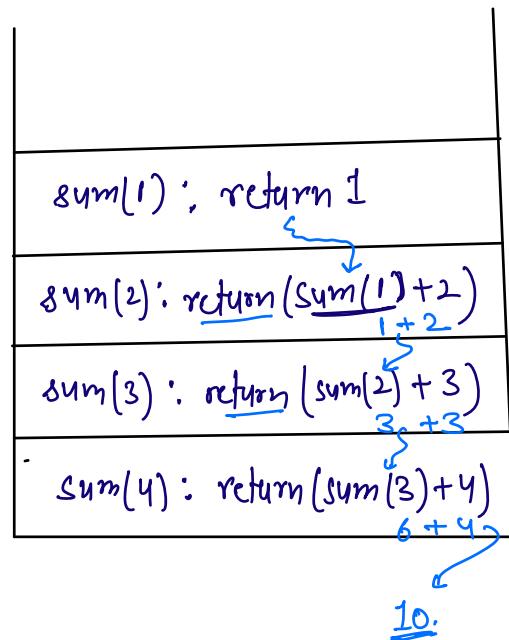

LIFO → Last In First Out.

//Sum Tracing ($N=4$)

Stack trace.

todo → trace factorial.

Without Base Condition Recursion won't stop, memory limit exceeds first.
 TLE Memory Limit Exceeded / Stack overflow

Note → In recursion, if your idea give Memory Limit Exceeded that means, code is not properly stopped, verify base conditions.

$$N \geq 0$$

input : 0 1 2 3 4 5 6 7 8 9 10
fib() : 0 1 1 2 3 5 8 13 21 34 55

int fib (N) { // Ass → calculate & return Nth fibonacci number.

```

    if (N <= 1) return N
    return {fib(N-1) + fib(N-2)}
  }
```

$$\text{fib}(5) \rightarrow 5$$

$$\text{fib}(6) \rightarrow 8$$

$$\text{fib}(7) \rightarrow 13$$

$\text{fib}(N) = \text{sum of previous 2 fib. numbers.}$

$$\underline{\text{fib}(N) = \text{fib}(N-1) + \text{fib}(N-2)}$$

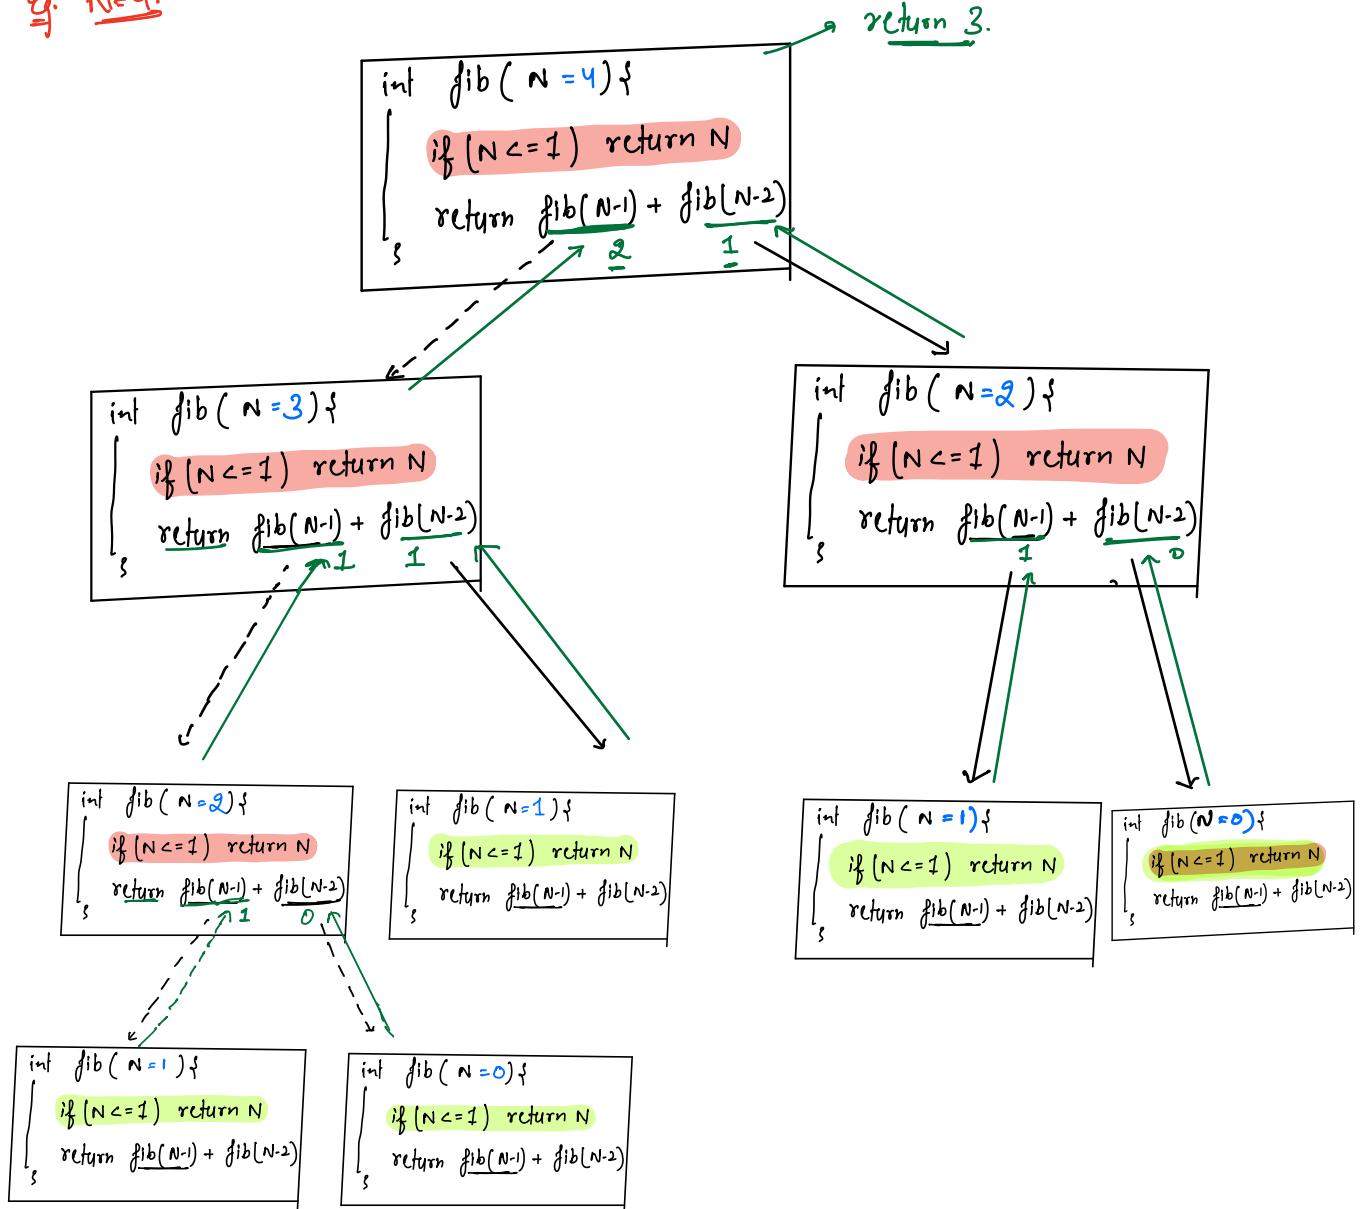

Note → How to figure out base conditions

→ valid values where expression will be invalid.

$$\left[\begin{array}{l} \text{fib}(0) = \text{fib}(-1) + \text{fib}(-2) \quad \times \\ \text{fib}(1) = \text{fib}(0) + \text{fib}(-1) \quad \times \end{array} \right]$$

$$\text{fib}(2) = \text{fib}(1) + \text{fib}(0) \quad \checkmark$$

Eg. $N=4$:

→ Try tracing it out with Stack (# todo)

Break → 11:42 → 11:50

// Given N , print all numbers from 1 → N in increasing order.

void PI (N) { // Assm → Give N, print all no's from [1,N] in increasing order.

{
 if (N == 1) { print 1 }
 ` PI(N-1)
 ` print(N)

$$PI(3) = 1 \ 2 \ 3$$

$$PI(4) = 1 \ 2 \ 3 \ 4$$

$$PI(N) = \underbrace{1 \ 2 \ 3 \ \dots}_{PI(N-1)} \ N$$

N=3.
void PI (int N) {
 if (N == 1) print N
 ` if (N > 1) {

 ` PI (N-1)
 ` print (N)

void PI (int N) {
 if (N == 1) print N
 ` if (N > 1) {
 ` PI (N-1)
 ` print (N)

void PI (int N) {
 if (N == 1) print N
 ` if (N > 1) {
 ` PI (N-1)
 ` print (N)

o/p.
1
2
3

N=4

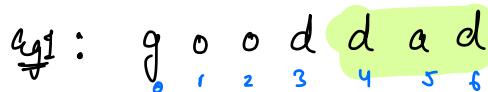

Q4.

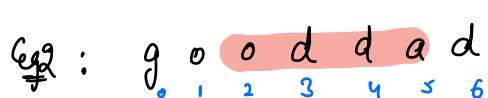

- 1
- 2
- 3
- 4

Note → Even for void functions, you can use return

→ function call will be removed from the stack.

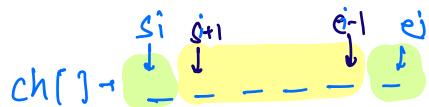

Q) Given a substring. Check if it is palindrome or not?
 $[s \leq e]$

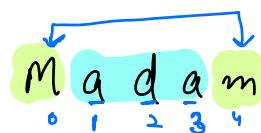

Ex1:  $s=4, e=6$: YES

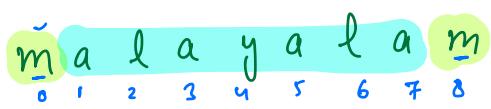

Ex2:  $s=2, e=5$: NO

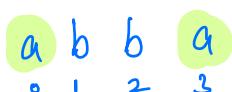

Assumption: Return, if substring from $[s, e]$ is palindrome or not.

```
boolean isPal( char[] ch, int si, int ei) {
    if (si > ei) { return true }
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

Ex:  $(0,4) \rightarrow (1,3)$
 sub-problem.

 $(0,7) \rightarrow (1,6)$
 sub-problem

Input - m a d d a m , $si=0$, $ei=5$ → return false.

```
bool isPal (ch[T], si=0, ei=s) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[T], si=1, ei=4) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[T], si=2, ei=3) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[T], si=3, ei=2) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

Input: a n m e t n a $s=0, e=6$ return false.

```
bool isPal (ch[T, si=0, ei=6]) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[T, si=1, ei=5]) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[T, si=2, ei=4]) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

Input: m a d a m
0 1 2 3 4

```
bool isPal (ch[ ], si=0 , ei=4) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[ ], si=1 , ei=3) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[ ], si=2 , ei=2) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
    return false
}
```

```
bool isPal (ch[ ], si=3 , ei=1) {
    if (si > ei) return true
    if (ch[si] == ch[ei] && isPal(ch, si+1, ei-1)) {
        return true
    }
}
```

```
[ ] return false
```

str → phad danh.

add a.
